ARTEM DORONIN

AI-NATIVE / AGENTIC AI ARCHITECT | AI SYSTEMS BUILDER | PRODUCT ARCHITECT

Bali, Indonesia / Remote | doronin.a.a@gmail.com | Telegram: @ShamanClub

PROFILE

Hands-on AI systems architect and product builder focused on AI-native development, multi-agent workflows, LLM orchestration, MCP-based tooling, automation, and rapid product prototyping. Designs systems where Claude, GPT and local models operate as engineering agents rather than standalone chatbots. Experience spans distributed AI infrastructure, agentic development workflows, content automation platforms, deterministic game architecture, and integration of AI into real products. Strong at decomposing complex products into architecture, services, tools, interfaces and implementation tasks for parallel AI-assisted development.

CORE EXPERTISE

Agentic AI Architecture — Multi-agent systems, task decomposition, tool-using agents, human-in-the-loop patterns

MCP & Tooling — Model Context Protocol, tool ecosystems, agent access boundaries, project-context workflows

Automation — n8n, workflow orchestration, content pipelines, publishing/analytics automation concepts

Product Prototyping — Fast MVP design, architecture-first iteration, technical specs, test-driven AI-assisted builds

LLM Integration — Anthropic Claude, OpenAI GPT, local models, model routing, voice/assistant integrations

AI-Native Development — Claude Code, parallel coding sessions, AI-assisted architecture, validation and review loops

Systems Architecture — API/worker separation, domain packages, command buses, deterministic cores, distributed nodes

Creative AI Stack — Generative video/image/audio workflows, ElevenLabs, Runway/Higgsfield-class tools, media automation

SELECTED AI / SOFTWARE PROJECTS

AI Content OS | *AI-native content production platform*

- Architected a monorepo with gateway, API, worker, media-worker and admin-web applications, plus reusable packages for core domain, configuration, AI gateway, agents, memory, media, observability and shared infrastructure.
- Designed the workflow around AI-assisted production: script → visual generation → thumbnails → publishing → analytics, with n8n integration and multiple model/provider pathways.
- Focused on separation of concerns, reusable agent services, observability and the ability to swap AI providers without redesigning the product.

Distributed AI Network Protocol | *Go 1.22 · libp2p · gRPC*

- Built an MVP architecture for a distributed AI network connecting PCs and mobile devices while prioritizing local processing and device-level privacy.
- Implemented/defined peer host discovery with mDNS + DHT, Ping/Pong, NodeInfo, capabilities, resource reporting and TaskSpec primitives for routing work across heterogeneous devices.
- Designed a model-routing concept that can choose between Anthropic, OpenAI and local NVIDIA-class models based on task complexity, cost and available compute.

Space Quest / ASTRAXIS | *Godot 4.5.1 · AI-assisted game architecture*

- Designed a simulation-first architecture for a space strategy game targeting a 25,000-system galaxy, with deterministic seed-based behavior and a strict separation between simulation core and Godot presentation layer.
- Established CommandBus-style boundaries so offline logic can later transition to online/server execution; LLMs have no privileged game-state access and the game remains fully playable without AI.
- Integrated the concept of an AI officer using Claude/GPT/local speech models and a large MCP tool surface; current prototype includes dozens of systems and 160+ automated tests.

AI DEVELOPMENT WORKFLOW

- Runs multiple Claude Code sessions in parallel on one codebase with task separation to reduce conflicts and increase throughput; exploring GPT/Codex as an additional independent engineering agent.
- Uses architecture briefs, implementation specs, invariant documents, acceptance criteria and automated tests to keep AI-generated code aligned with product intent.
- Prefers systems where the LLM is replaceable and constrained by explicit tools, permissions and interfaces rather than embedded as an uncontrolled source of truth.
- Comfortable moving from concept and product requirements to architecture, prompts/specs, implementation tasks, validation and iterative debugging.

ADDITIONAL PRODUCT / PRODUCTION EXPERIENCE

Content Studio & AI Media Production | ***Producer / Operator / Workflow Designer***

- Led strategy, scripting, shooting, editing, SEO, thumbnails and publishing workflows for commercial content projects, including real estate and developer clients.
- Built practical generative-media workflows using AI video, image, voice and automation tools; optimized prompts and production pipelines for consistency, realism and repeatability.
- Experience translating business requirements into repeatable production systems — useful for forward-deployed AI, internal automation and client-facing solution architecture.

TECHNOLOGY

AI / LLM: Claude / Anthropic, OpenAI GPT, local LLMs, model routing, agent workflows, MCP
Development: Go, GDScript, API architecture, gRPC, libp2p, Git/GitHub, Docker-oriented infrastructure
Automation: n8n, Telegram bot workflows, AI content pipelines, API integrations
Game / Simulation: Godot 4.5.1, deterministic simulation, CommandBus patterns, large-system procedural architecture
Knowledge / Workflow: Obsidian, technical specs, architecture docs, multi-agent task orchestration
Creative AI: Higgsfield, Runway-class workflows, ElevenLabs, HeyGen, generative image/video/audio tools

WORKING STYLE

- Architecture-first, prototype-fast, validate with tests and real use cases.
- Strong product perspective: focuses on what the system must accomplish, then chooses models and tools accordingly.
- Comfortable in ambiguous, early-stage environments where architecture, implementation and product requirements evolve together.
- Based in Bali, Indonesia; open to remote international roles and project-based / contract collaboration.
